

**Would You Trust An Umbrella
That Covers Only Half?**

**You wouldn't — and neither
should your patients.**

Complete 360° Urine Collection

More Coverage Where it Counts

CareDry[®] features more than double the absorptive surface area compared to a competing female external catheter. That could mean more fluid captured, improved moisture control, and potentially fewer disruptions to patient care.

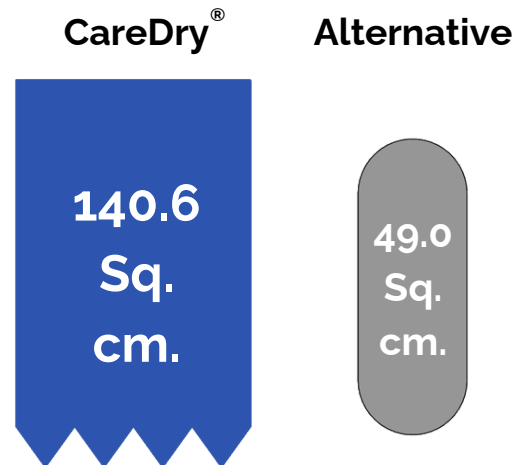

The CareDry[®] Surface Area Advantage:

- Significantly Larger Surface Area → Designed to support faster, more effective fluid capture
- Enhanced Skin Contact → Supports consistent performance across varied anatomy and positioning
- Supports Better Moisture Control → Facilitates skin dryness and may help minimize the risk of skin maceration

Why It Matters in Clinical Practice

- Greater absorption can lead to better fluid capture and more accurate input/output measurements
- Increases reliability during patient repositioning or movement
- Designed to enhance clinical confidence in critical care situations
